

Galactagogues

Galactagogues are medications, herbs or foods which can provide a small to moderate increase in milk production. A galactagogue may be helpful if you are not producing enough milk. If there are latch or positioning issues, these should be addressed first (see *Positioning and Latching*). However if your baby is latching well and you are breastfeeding frequently, a galactagogue might be needed (see [Low Milk Production](#)). If you are considering using a pharmaceutical or herbal galactagogue, consult with your healthcare professional.

Pharmaceutical Galactagogues

Domperidone (Motilium™) is a prescription drug that is approved by Health Canada to treat gastrointestinal issues such as nausea and reflux. This drug boosts prolactin and has the side effect of increasing milk production in breastfeeding women. Even though it is not designed for this use, some doctors choose to prescribe this drug to increase milk production. Very little domperidone passes into mother's milk and it is considered safe for a breastfeeding baby.

Doctors will often require an electrocardiogram (ECG or EKG) to confirm your heart health before considering prescribing this medication. Domperidone inhibits the hormone dopamine and can interact with some medications, like anti-anxiety medications, which increase dopamine.

Domperidone usually begins to work within 48 hours. If you do not notice any difference within one week, the galactagogue is likely not working for you. Domperidone usually reaches peak level of effectiveness between 2 and 4 weeks.

Once full milk production is achieved, speak to your healthcare provider or International Board Certified Lactation Consultant (IBCLC) about how to slowly reduce your dosage of domperidone. Some people are able to eliminate it entirely in a couple of weeks. Other people remain on the medication for several months before slowly eliminating it.

Metoclopramide (Maxeran™, Reglan™) is also known to increase milk production, but it has frequent side effects which have made its use for breastfeeding mothers unacceptable. These include fatigue, irritability, depression, tardive dyskinesia (involuntary repetitive body movements), oculogyric crisis (spasmodic movement of the eyeball). This is rarely prescribed in Canada to increase milk production.

Herbal Galactagogues

Herbs and plant-based galactagogues have been used in many cultures throughout history. However, there has been little scientific research about the effectiveness of these plants on milk production. The doses of different herbal preparations are not standardized. Herbs can be as powerful as manufactured drugs. They can also have serious side effects. That said, many mothers have safely used herbs to increase their milk production. Discuss any new medication or herb with your health care professional before starting it. [La Leche League Canada Leaders](#) can provide you with information that you can share with your healthcare provider.

Some of the most commonly used herbal galactagogues are: fenugreek, blessed thistle, fennel, alfalfa, stinging nettle, goat's rue, milk thistle, and moringa. Herbal galactagogues can be consumed as teas, powders, or capsules or as foods.

Foods considered to be Galactagogues

Every culture has foods that have been traditionally used to increase milk production. There is no strong scientific evidence for any of these foods. However good nutrition will make you feel better and support milk production. Consider adding these foods that you enjoy eating to your diet. Some of the common foods which are considered galactagogues are:

- Oatmeal
- Dark, leafy greens (alfalfa, kale, spinach, broccoli)
- Fennel
- Garlic
- Chickpeas
- Nuts and seeds, especially almonds
- Ginger
- Papaya
- Spices like anise seeds, caraway, coriander, cumin seeds, dill, fennel seeds, fenugreek, turmeric

Pharmacist Frank Nice and his wife, Myung Hee, have put together more than 200 recipes featuring foods considered as galactagogues in "[The Galactagogue Recipe Book](#)". Dr. Nice includes dosage, uses, and cautions about each of the galactagogues.

If you have questions about your milk supply, or other breastfeeding challenges, please [contact your local La Leche League Canada Leader](#). LLL Leaders can also share additional information about galactagogues.
